Vue-Slider

The goal is to extend the existing app with a slider functionality. On the desktop view all Teasers per Block are visible. When you switch to tablet view the teasers currently switch to the next row. In that moment the Block row should change into a slider. That way the page doesn't get longer but the content is still available. When the page changes back to desktop view, all Teasers should be visible again and the slider should disappear.

Requirements:
- Create a slider component
- Create unit tests for that component

Bonus Requirements:
- Use the same slider component to create a slider for the „hero" which sits right under the header/navigation
- Get the Block title on the same vertical level as the teasers in all views
